

CAN'T FACE
THE WORLD?

F A C I A L P A L S Y

Weakness of the face muscles can be caused by temporary or permanent damage to the facial nerve

Proper early management of facial palsy can prevent long term problems and aid your recovery.

The physio will carry out an assessment of your face at rest and when moving. **If your face is drooping, advice can be given for eye and mouth care and how to use tape to support the face.**

Early treatment uses Trophic Electrical Stimulation (TES), passive stretches and exercise. Later on you may need biofeedback to train **independent face muscle activity.**

A treatment plan is designed to meet your individual needs. The emphasis is on home treatment with periodic assessments at the clinic.

Our specialist physio is always happy to speak with you prior to scheduling your first appointment if you would like to find out more about the service before you book an appointment.
